## Login System Flowchart Diagram

In the designed flowchart for login system, first system begins. Program flows to next block where input from user is taken in form of username and password. Then connection with database is made in next block. Next flow of the program is decision block where information provided by user is compared to admin information in database. If information matches, flow of program is directed to admin dashboard. Otherwise flow of program is directed to next block where user information from database is compared to information provided by user. If information matches, program is directed to user dashboard. If information from database and from user does not matches, program flow is directed to display error block where warning message to user is provided and in next flow user are again allowed to enter username and password information.
